

Understanding Digital showering and bathing

Aqualisa's award-winning Digital technology has spearheaded a new generation of showers and baths.

With intelligent features exclusive to Aqualisa, Digital showers and baths couldn't be simpler to use. Plus, with some installations taking just two hours to complete and minimal disruption, Digital will get you showering and bathing double-quick, too!

No matter what member of the Aqualisa Digital product family you choose, you can be sure of nothing less than a truly outstanding performance. Spot-on, thermostatic temperatures, reliable flow, easy one touch controls and an illuminated display that lets you know when it's time to shower or bathe.

These, plus other optional features such as an Eco setting and a remote control that lets you get your shower or bath up and running from outside the bathroom, all come courtesy of the advanced processor at the heart of every Aqualisa Digital shower or bath fill. So whatever your style preference, bathroom requirements or budget, you can be sure, that thanks to Digital, there will be an Aqualisa shower or bath fill to suit.

Axis Digital

Sleek, cylindrical design and an illuminated display that indicates when it's time to shower.

Put off installing a new shower or bath fill because of the disruption and work involved? Don't be. Aqualisa's award-winning Digital technology makes it easy.

So how does it work? Central to every Aqualisa shower or bath fill is a sophisticated processor – the digital product's nerve centre. Unlike a conventional shower valve, the processor can be situated up to 10 metres away from the showering area. A slim data cable connects the processor to the shower or bath control.

This unique configuration has many advantages – the digital control can be positioned wherever is convenient and because there is no need to conceal pipework or a valve, installation can be completed in as little as two hours, with minimal damage to décor, tiling and walls. Hot and cold water flows into the processor and is mixed with perfect precision. Every processor has a factory pre-set maximum temperature of 45°C* – making it safe for everyone. You can also set the processor box to 'Eco Mode' to conserve water usage without compromising performance. Once blended, the water then leaves the processor and travels to the shower head or bath filler. What could be simpler?

Digital processor for HP/Combi

This compact Digital processor is for use with a combination boiler or mains fed water heating system.

Digital processor for Gravity

This compact Digital processor is for use with gravity fed water systems. It integrates a pump to provide extra power.
